Package 'aRtsy'

August 8, 2021

Title Generative Art with 'ggplot2'
Description Combines several algorithms for creating artworks in the ggplot2 language that incorporate some form of randomness (depending on the set seed).
Version 0.1.0
Date 2021-08-07
BugReports https://github.com/koenderks/aRtsy/issues
<pre>URL https://github.com/koenderks/aRtsy</pre>
Imports dplyr, ggplot2, ggpubr, Rcpp, reshape2
LinkingTo Rcpp, RcppArmadillo
Language en-US
License GPL-3
Encoding UTF-8
RoxygenNote 7.1.1
Suggests testthat (>= 3.0.0)
Config/testthat/edition 3

aRtsy-package aRtsy — Generative Art using ggplot2	
--	--

Description

aRtsy is an attempt at making generative art available for the masses in a simple and standardized format. The package combines several algorithms for creating artworks in ggplot2 that incorporate some form of randomness (depending on the set seed). Each type of artwork is implemented in a separate function.

For documentation on aRtsy itself, including the manual and user guide for the package, worked examples, and other tutorial information visit the package website.

canvas_ant Paint Lan	gton's Ant on a Canvas
----------------------	------------------------

Description

This function paints Langton's Ant. Langton's ant is a two-dimensional universal Turing machine with a very simple set of rules but complex emergent behavior.

Usage

Arguments

colors a character (vector) specifying the colors for the ant.
background a character specifying the color of the background.
iterations the number of iterations of the ant.
width the width of the artwork in pixels.
height the height of the artwork in pixels.

canvas_arcs 3

Value

A ggplot object containing the artwork.

Author(s)

Koen Derks, <koen-derks@hotmail.com>

References

```
https://en.wikipedia.org/wiki/Langton%27s_ant
```

Examples

```
canvas_ant(colors = '#000000', background = '#fafafa')
```

canvas_arcs

Paint Arcs on a Canvas

Description

Inspired by the work of @ijeamaka_a, this type of artwork mimics her beautiful Arc Series. For private use only.

Usage

Arguments

colors a character vector specifying the 3 colors used for the arcs.

background a character string specifying the color used for the background.

n an integer specifying how many arcs should be put on the canvas.

nrow an (optional) integer specifying the number of rows on the canvas.

ncol an (optional) integer specifying the number of columns on the canvas.

dir a character string specifying which direction the arcs turn. Can be one of "right"

(default) or "left".

starts a character sting specifying where the arcs should start. Can be one of "clockwise"

(default) or "random".

Value

A ggplot object containing the artwork.

Author(s)

Koen Derks, <koen-derks@hotmail.com>

```
aRtsy:::canvas_arcs(colors = c('darkgreen', 'goldenrod', 'firebrick'), n = 9)
```

4 canvas_circlemap

canvas_	ci	rcl	emar)
canvas_	~ -		Ciliar	•

Paint a Circle Map on a Canvas

Description

This function is my attempt at a circle map.

Usage

```
canvas_circlemap(colors, x_min = 0, x_max = 12.56, y_min = 0, y_max = 1, iterations = 10, width = 1500, height = 1500)
```

Arguments

colors	a character specifying the color used for the function shape.
x_min	a numeric value specifying the minimum value for the x-axis.
x_max	a numeric value specifying the maximum value for the x-axis.
y_min	a numeric value specifying the minimum value for the y-axis.
y_max	a numeric value specifying the maximum value for the y-axis.
iterations	the number of iterations.
width	the width of the artwork in pixels.
height	the height of the artwork in pixels.

Value

A ggplot object containing the artwork.

Author(s)

```
Koen Derks, <koen-derks@hotmail.com>
```

References

```
https://linas.org/art-gallery/circle-map.html
```

```
canvas_circlemap(colors = colorPalette('tuscany2'))
```

canvas_diamonds 5

diamonds	

Paint A Diamond on Canvas

Description

This function draws many diamonds on the canvas and places two lines behind them. The diamonds can be transparent or have a random color sampled from the input.

Usage

Arguments

colors a character (vector) specifying the colors used for the strokes.

background a character specifying the color used for the background.

col.line color of the lines.

radius of the diamonds.

alpha transparency of the diamonds. If NULL, added layers become increasingly more

transparent.

size size of the borders

p takeover probability.

width the width of the artwork in pixels.

height the height of the artwork in pixels.

Value

A ggplot object containing the artwork.

Author(s)

```
Koen Derks, <koen-derks@hotmail.com>
```

```
set.seed(1)
canvas_diamonds(colors = colorPalette('tuscany3'), radius = 10)
```

6 canvas_planet

canvas_function

Paint Functions on a Canvas

Description

This function paints functions with random parameters and mimics the functionality of the generativeart package.

Usage

```
canvas_function(color, background = '#fafafa')
```

Arguments

color a character specifying the color used for the function shape. background a character specifying the color used for the background.

Value

A ggplot object containing the artwork.

Author(s)

Koen Derks, <koen-derks@hotmail.com>

References

```
https://github.com/cutterkom/generativeart
```

Examples

```
set.seed(10)
canvas_function(color = '#000000', background = '#fafafa')
```

canvas_planet

Paint a Planet on a Canvas

Description

This function paints one or multiple planets.

Usage

7 canvas_polylines

Arguments

colors a character specifying the colors used for the planet(s). Can also be a list where each entry is a vector of colors for each planet. a character specifying the threshold for a color take. threshold

iterations the number of iterations of the planets

starprob the probability of drawing a star in outer space.

fade the fading factor.

radius a numeric (vector) specifying the radius of the planet(s). center.x the x-axis coordinate(s) for the center(s) of the planet(s). center.y the y-axis coordinate(s) for the center(s) of the planet(s). whether to draw the light from the right or the left. light.right

width the width of the artwork in pixels. height the height of the artwork in pixels.

Value

A ggplot object containing the artwork.

Author(s)

Koen Derks, <koen-derks@hotmail.com>

Examples

```
# Sun behind Earth and Moon
set.seed(1)
colors <- list(c("khaki1", "lightcoral", "lightsalmon"),</pre>
               c("dodgerblue", "forestgreen", "white"),
               c("gray", "darkgray", "beige"))
canvas_planet(colors, radius = c(800, 400, 150),
              center.x = c(1, 500, 1100),
              center.y = c(1400, 500, 1000),
              starprob = 0.005)
```

canvas_polylines

Paint Polygons and Lines on Canvas

Description

This function draws many points on the canvas and connects these points into a polygon. After repeating this for all the colors, the edges of all polygons are drawn on top of the artwork.

Usage

```
canvas_polylines(colors, background = '#fafafa', ratio = 0.5, iterations = 1000,
                 alpha = NULL, size = 0.1, width = 500, height = 500)
```

8 canvas_ribbons

Arguments

colors a character (vector) specifying the colors used for the strokes.

background a character specifying the color used for the borders.
ratio width of the polygons. Larger ratios cause more overlap.

iterations the number of points for each polygon.

alpha transparency of the polygons. If NULL, added layers become increasingly more

transparent.

size size of the borders.

width the width of the artwork in pixels.
height the height of the artwork in pixels.

Value

A ggplot object containing the artwork.

Author(s)

Koen Derks, <koen-derks@hotmail.com>

Examples

```
set.seed(1)
canvas_polylines(colors = colorPalette('retro2'))
```

canvas_ribbons

Paint Ribbons on a Canvas

Description

This function paints ribbons and (optionally) a triangle in the middle.

Usage

```
canvas_ribbons(colors, background = '#fdf5e6', triangle = TRUE)
```

Arguments

colors a character (vector) specifying the colors for the ribbons. Colors determine the

number of ribbons.

background a character specifying the color of the background.

triangle logical. Whether to draw the triangle that breaks the ribbon polygons.

Value

A ggplot object containing the artwork.

Author(s)

Koen Derks, <koen-derks@hotmail.com>

canvas_segments 9

Examples

```
set.seed(1)
canvas_ribbons(colors = colorPalette('tuscany1'))
```

canvas_segments

Paint Line Segments on Canvas

Description

This function draws many line segments on the canvas.

Usage

```
canvas_segments(colors, background = '#fafafa', n = 100, p = 0.5, H = 0.1, size = 0.2)
```

Arguments

colors	a character (vector) specifying the colors used for the strokes.
background	a character specifying the color used for the background.
n	the number of line segments to draw.
p	probability of drawing a vectical line segment.
Н	scaling factor for the line segments.
size	line width of the segments.

Value

A ggplot object containing the artwork.

Author(s)

```
Koen Derks, <koen-derks@hotmail.com>
```

```
set.seed(1)
canvas_segments(colors = 'black', background = '#fafafa')
```

10 canvas_strokes

canvas	_squares

Paint Squares on a Canvas

Description

This function paints a squares. It works by repeatedly cutting into the canvas at random locations and coloring the area that these cuts create.

Usage

Arguments

colors a character vector specifying the colors used in the squares.

background a character specifying the color used for the background (borders).

cuts the number of cuts to make.
ratio the 1:1 ratio for each cut.

width the width of the artwork in pixels.
height the height of the artwork in pixels.

Value

A ggplot object containing the artwork.

Author(s)

Koen Derks, <koen-derks@hotmail.com>

Examples

```
set.seed(6)
canvas_squares(colors = colorPalette('tuscany1'))
```

canvas_strokes

Paint Strokes on a Canvas

Description

This function creates an artwork that resembles paints strokes. The algorithm is based on the simple idea that each next point on the grid has a chance to take over the color of an adjacent colored point but also has a change of generating a new color.

Usage

canvas_turmite 11

Arguments

colors a character (vector) specifying the colors used for the strokes.

neighbors the number of neighbors a block considers when taking over a color. More

neighbors fades the artwork.

p the probability of selecting a new color at each block. A higher probability adds

more noise to the artwork.

iterations the number of iterations on the artwork. More iterations fade the artwork.

width the width of the artwork in pixels.

height the height of the artwork in pixels.

side whether to turn the artwork on its side.

Value

A ggplot object containing the artwork.

Author(s)

Koen Derks, <koen-derks@hotmail.com>

Examples

```
set.seed(1)
canvas_strokes(colors = colorPalette('tuscany3'))
```

canvas_turmite

Paint a Turmite on a Canvas

Description

This function paints a turmite. A turmite is a Turing machine which has an orientation in addition to a current state and a "tape" that consists of a two-dimensional grid of cells. The algorithm is simple: 1) turn on the spot (left, right, up, down) 2) change the color of the square 3) move forward one square.

Usage

Arguments

color a character specifying the color used for the turmite.

background a character specifying the color used for the background.

p the probability of a state switch within the turmite.

iterations the number of iterations of the turmite.
width the width of the artwork in pixels.
height the height of the artwork in pixels.

12 colorPalette

Value

A ggplot object containing the artwork.

Author(s)

```
Koen Derks, <koen-derks@hotmail.com>
```

References

```
https://en.wikipedia.org/wiki/Turmite
```

Examples

```
set.seed(1)
canvas_turmite(color = "#000000", background = "#fafafa")
```

colorPalette

Color palette generator.

Description

This function creates a random color palette, or allows the user to select a pre-implemented palette.

Usage

```
colorPalette(name, n = NULL)
```

Arguments

name

name of the color palette. Can be random for random colors, but can also be the name of a pre-implemented palette. See the details section for a list of pre-implemented palettes.

n

the number of colors to select from the palette. Required if name = 'random'. Otherwise, if NULL, automatically selects all colors from the chosen palette.

Details

The following color palettes are implemented:

saveCanvas 13

Value

A vector of colors.

Author(s)

Koen Derks, <koen-derks@hotmail.com>

saveCanvas

Save a canvas to an external device.

Description

This function is a wrapper around ggplot2::ggsave. It provides a suggested export with square dimensions for a canvas created using the aRtsy package.

Usage

saveCanvas(plot, filename, resolution)

14 themeCanvas

Arguments

plot a ggplot2 object to be saved. filename the filename of the export. resolution the dpi of the export.

Author(s)

Koen Derks, <koen-derks@hotmail.com>

themeCanvas

Canvas theme for ggplot2 objects

Description

Add a canvas theme to the plot. The canvas theme by default has no margins and fills any empty canvas with a background color.

Usage

```
themeCanvas(x, background = '#fafafa', margin = -1.25)
```

Arguments

x a ggplot2 object.

background a character specifying the color used for the empty canvas.

margin margins of the plot.

Value

A ggplot object containing the artwork.
